EDUCATION

Columbia University

MS in Computer Science (Machine Learning Track)

New York, NY

Sep 2026 – Dec 2027

Korea Advanced Institute of Science and Technology (KAIST)

BS in Computer Science

Daejeon, KR

Aug 2026

Courses: Machine Learning, Computer Vision, Information Retrieval, Database, Data Structures, Algorithms

SKILLS

Programming Languages: Python (Proficient), Java (Intermediate), C (Intermediate), JavaScript (Intermediate)

Frameworks & Libraries: FastAPI, LangChain, LangGraph, PyTorch, Scikit-learn, Transformers, TRL, React

Infrastructure & Tools: Docker, Langfuse, LangSmith, Supabase, PostgreSQL, WandB, Vercel, Fly.io, Jira, Confluence

Languages: Korean, English

EXPERIENCE

AI Research Intern

Seongnam, KR

NC AI (AI Research Group of NCSoft)

Sep 2025 – Feb 2026

- Designed an evaluation system for a LangGraph-based RAG chatbot to gauge response quality without relying on external LLM API calls, eliminating data privacy risks by fine-tuning an open-source LLM with GRPO method
- Implemented context-aware decoding pipeline with Transformers library to generate synthetic responses with varying contextual relevance, strengthening model's response-ranking capability via custom reward functions
- Validated fine-tuned model on 500 internal chat samples, achieving 86.3% agreement with human evaluators, an 8.8% improvement over standard RAGAS metrics, while cutting evaluation latency by 20%
- Deployed fine-tuned model as a Docker container and integrated evaluation module as a LangGraph node, enabling real-time, privacy-preserving response quality checks within live chatbot workflow
- Collaborated with customer support team to utilize evaluation module toward faster inquiry assessment

Undergraduate Researcher

Seoul, KR

KAIST AI

Jan 2025 – Aug 2025

- Identified underutilization of user reviews as a preference signal in multimodal recipe recommenders and developed a framework incorporating users' dietary preferences into user and recipe representation learning
- Constructed a data pipeline across two datasets (~76K users, ~75K recipes), prompting a VLM and LLM to summarize each user's dietary preference and each recipe's image, ingredients, and nutrition
- Utilized these summaries as multimodal embeddings and applied graph propagation and cross-view contrastive learning to align multimodal and learnable user and recipe embeddings
- Achieved 7–15% Recall@10 gains over 3 advanced multimodal recipe recommendation baselines, while cutting both training time and peak VRAM usage taken to learn user and recipe embeddings by 3x

PROJECTS

LionPlanner ([Link](#))

- Built a full-stack course-planning web app end-to-end using Claude Code, combining a LangGraph-based agentic chatbot, FastAPI backend, and Supabase vector search, then deployed it to production on Vercel and Fly.io
- Scraped syllabi and reviews for 36 Columbia CS courses and created a workload-grading pipeline across 5 dimensions using LLM, grounding each score in verbatim evidence with anchor calibration
- Engineered an agentic workflow generating responses using tools for semantic search, degree requirement lookup, and schedule-conflict checking for context-aware course recommendation
- Evaluated course recommendation quality across 100 queries and earned an average rating of 4.35/5

LEADERSHIP

Unit Leader

- Led a team of 8 during mandatory military service, working closely with members to flawlessly organize 5 national ceremonies under strict guidelines to welcome foreign heads of state visiting Korea
- Trained 20 incoming recruits on ceremonial procedures by communicating through hands-on demonstrations and individualized feedback, ensuring all recruits are deployed to live events without error
